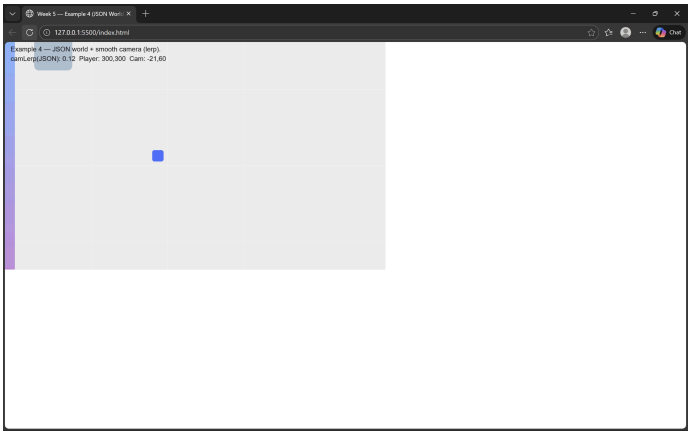
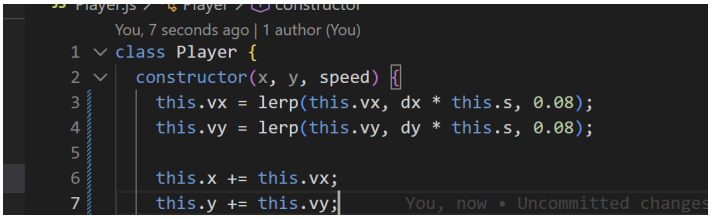
Process & Decision Documentation

Side Quest #5 Decisions

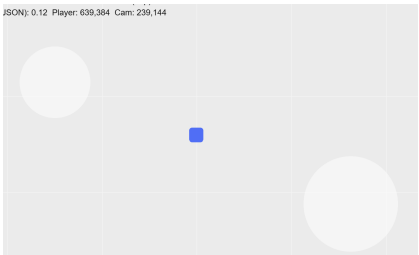
For this sidequest, I wanted to test out all the ideas that GenAI produces from me based on my prompt. The thing that I realized quickly is how some ideas the AI does not seem to know the logic and when I tried to test the code, it resulted in something not as intended. I used a process of elimination method and, depending on how significant the issue was without lots of editing to see which ideas I could combine together.



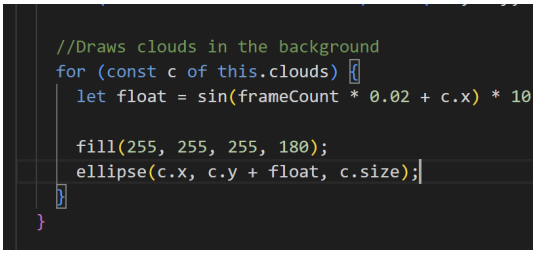
I wanted to make the background of the game the dreamlike colours, but instead GenAI made the actual screen background the colour inside the world… -> have to example to it that I meant the grid behind the player. Since the original code used the JSON variables for the grid slide under “world”, the AI did not detect that and only followed “background”.



(My screen is gone from this code??) ->



(clouds???)



I had to adjust the code and add more shaping to look like an actual cloud. Adding in more ellipse shapes, since the AI imagine clouds as a perfect circle.

```
}

draw() {
  push();
  translate(this.x, this.y);

  // speed controls flap strength
  let speed = abs(this.vx) + abs(this.vy);

  let flap = sin(frameCount * 0.5) * (4 + speed * 1.5);        You, now • Unco

  noStroke();

  // glow
  fill(255, 240, 200, 80);
  ellipse(0, 0, 26 + flap * 0.3);
```

Adjusting the player character, have to modify the equation through trial and error as well as changing the visuals.

```
  // move in a consistent diagonal direction
  s.x += this.starSettings.speed;
  s.y -= this.starSettings.speed;
```

The code that ChatGPT gave for the direction of the stars moves up (-y) and right, instead of down (+y) and left.

GenAI Documentation

Date Used: February 21 - 22, 2026

Tool Disclosure: ChatGPT 5.2

Purpose of Use: Using GenAI to help aid in coding a mini dreamlike map for sidequest 5

Summary of Interaction: I used ChatGPT to generate ideas and help code the mini world.

Human Decision Point(s): Took charge of defining specific variables of the codes and what aspect of Chat decisions and interpretation of the theme.

Integrity & Verification Note: I ran the code in VS-Code and double-checked on Live Server if the output matches what the code states. I also took screenshots of my progress and the result of what I got from some of the coding.

Scope of GenAI Use: GenAI is used primarily as a coding tool for this project, with human input.

Limitations or Misfires: Specific naming or intent should be clear, or else it would take in the exact data that matches the instructions of the prompts. When I asked it to change the background, I assumed it knew I meant the original grid behind the player and not the screen behind the grid. I assumed since ChatGPT has been trained with lots of data that it wouldn't make random mistakes, but when trying to create a shooting star, I think on the world it does not know how to associate "up" and "down" for the skys.

Summary of Process (Human + Tool):

- Prompts for ideas of "dreamlike" elements to add to world
- Test each prompt ideas to validate code
- Edit or tweak variables if needed to fit vision
- Follow up prompts for background code

Verification & Judgement

- For each ideas, I individually tested them in VSCode to validate if they would work with the current code without much-needed edits
